

Hospital Emergency Room Dashboard Report

Business Context

The Hospital Emergency Room (ER) Dashboard was created to analyze patient admissions from April 2023 to October 2024. The dashboard provides information about patient admissions, waiting time, department referrals, patient demographics, and satisfaction. It helps hospital staff and management understand patient trends and support better decision-making to improve hospital services.

Problem Statement

The hospital needs a better way to monitor Emergency Room performance and understand patient trends. This dashboard answers the following questions:

- When is the Emergency Room busiest?
- Which department receives the most patient referrals?

- Which months have the highest number of patient admissions?
- How do waiting time and patient satisfaction affect hospital services?

Key Insights and Findings

Peak Hours in the Emergency Room

The dashboard shows that the ER is busiest between 10:00 AM and 12:00 PM and again from 2:00 PM to 5:00 PM. Fridays and Saturdays around 11:00 AM have the highest number of patients. During these hours, more patients visit the ER, so the hospital may need more staff to reduce waiting time and provide faster service.

Department Referrals

Most patients were referred to General Practice, making it the department with the highest number of referrals. Other departments, such as Orthopedics, Physiotherapy, Cardiology, and Neurology, had fewer referrals. This means that General Practice handled more patients than the other departments.

Monthly Patient Admissions

The number of patient admissions changes every month. The dashboard shows that August to October had the highest number of patients, while January had the lowest. This means the hospital is busier during some months and should be ready for more patients.

Waiting Time and Patient Satisfaction

The average waiting time is 35 minutes, and the average patient satisfaction score is 5 out of 10. Patients may be less satisfied when they wait longer for treatment. Reducing waiting time may help improve patient satisfaction.

Recommendations

Add More Staff During Busy Hours

The hospital should assign more doctors, nurses, and support staff during the busiest hours, especially from 10:00 AM to 5:00 PM. This can help reduce waiting time and allow patients to receive treatment faster.

Faster Patient Service

The hospital can create a separate line or fast-track system for patients with minor health problems. This can help reduce waiting time and allow patients with serious conditions to receive treatment faster.

Prepare for Busy Months

The hospital should prepare for the higher number of patients from August to October by making sure there are enough staff, beds, medicines, and medical supplies.

Improve Patient Satisfaction

The hospital should reduce waiting time and keep patients informed about possible delays. Giving updates while patients wait can help improve their overall experience.

Potential Impact

If these recommendations are applied, the hospital can reduce patient waiting time, improve patient satisfaction, and provide faster emergency care. Better staff planning during busy hours and preparing for the busiest months can also improve patient flow and make hospital operations more efficient.

Summary

Based on the dashboard analysis, the Emergency Room handled 9,216 patient admissions from April 2023 to October 2024. The results show that the ER is busiest between 10:00 AM and 5:00 PM, especially on Fridays and Saturdays. General Practice received the highest number of referrals, while patient admissions were highest from August to October. The average waiting time was 35 minutes, and the average patient satisfaction score was 5 out of 10.

To improve hospital services, the hospital should assign more staff during busy hours, provide faster service for patients with minor health problems, prepare for busy months, and reduce waiting time to improve patient satisfaction. These recommendations can help improve patient flow and provide better emergency care.
